Jahrgang 1888.

I. Theil: Meteorologische Beobachtungen in Deutschland, angestellt an 9 Stationen zweiter Ordnung.

II. Theil: Stündliche Aufzeichnungen der autographischen Apparate für Luftdruck, Temperatur, Windrichtung und Windgeschwindigkeit an den Normal-Beobachtungs-Stationen der Deutschen Seewarte, sowie von Kaiserslautern.

III. Theil: Zur Statistik der Stürme an der Deutschen Küste, nebst einen Nachtrag für 1887.

Vorwort.

Das Vorwort zum Jahrgang X dieser Publikation verbreitete sich im Einzelnen über alles das, was mit der Entwicklung der Herausgabe deutscher meteorologischer Beobachtungen seit 1876 im Zusammenhange steht; es mag deshalb im Wesentlichen darauf verwiesen und hier nur das berührt werden, was eine unmittelbare Beziehung zum vorliegenden Bande hat. Wir entnehmen jenem Vorworte daher mit entsprechender Abänderung die nachfolgenden Bemerkungen.

Da die Herausgabe der »Meteorologischen Beobachtungen in Deutschland« durch Beschluss deutscher Meteorologen und Vertreter meteorologischer Institute in Deutschland im Jahre 1876 erfolgt war, so konnte dieselbe nicht ohne Weiteres sistirt werden, vielmehr wurde es für erforderlich erachtet, einen Beschluss der nun vollzählig vertretenen Institute herbeizuführen, was durch eine bei Gelegenheit der Jahresversammlung der Deutschen Meteorologischen Gesellschaft in Karlsruhe zusammenberufene Konferenz der Vorstände der meteorologischen Institute in Deutschland im April 1887 auch bewirkt worden ist. War man auf dieser Konferenz sich darüber einig, dass eine Herausgabe der Meteorologischen Beobachtungen in Deutschland hinfort seitens der einzelnen Institute zu erfolgen habe, so war man auch überzeugt, dass das einheitliche Band für diese Veröffentlichung sich nicht lösen dürfe und durch ein äusseres Zeichen fernerhin gewahrt bleiben müsse. In diesem Sinne wählte man die allen einzelnen Herausgaben gemeinsame Ueberschrift **„Deutsches Meteorologisches Jahrbuch"**, zu welcher noch das Land oder das System hinzugefügt werden sollte. Als Zeitpunkt für den Beginn der neuen Publikation setzte die Konferenz den 1. Januar 1887 fest. Ferner erschien es wünschenswerth, dass die einmal errungene Zusammengehörigkeit dadurch gewahrt bleiben sollte, dass der Veröffentlichung der Deutschen Seewarte die Inhalts-Verzeichnisse auch der Veröffentlichungen der übrigen Deutschen Institute einverleibt würden; es war Dies um so empfehlenswerther, als durch ein solches Verfahren die bibliographische Uebersicht deutscher meteorologischer Publikationen sehr erleichtert werden konnte.

Der nun der Oeffentlichkeit übergebene Band des **„Deutsches Meteorologisches Jahrbuch für 1888. Beobachtungs-System der Deutschen Seewarte"** ist nach den im Vorstehenden niedergelegten Gesichtspunkten zusammengestellt und erscheint als Jahrgang XI. Um nun auch die beiden Jahrgänge 1876 und 1877 in die Serie mit einzuschliessen, wurde der Bezeichnung und Nummerirung noch hinzugefügt: »Dreizehnter Jahrgang der Meteorologischen Beobachtungen in Deutschland«.

In der Einleitung zu dem vorliegenden Bande, sowie in den einleitenden Bemerkungen in den früheren Jahrgängen ist alles zum Verständnisse der in denselben niedergelegten Resultate Erforderliche enthalten. Zusammenstellung, Drucklegung und Revisionen geschahen ebenso wie bei den Jahrgängen I—X dieser Veröffentlichung in der Abtheilung III und durch den Vorsteher derselben Dr. van Bebber.

Einleitung.

Der vorliegende Jahrgang »Deutsches Meteorologisches Jahrbuch für 1888, Beobachtungs-System der Deutschen Seewarte« (Elfter beziehungsweise dreizehnter Jahrgang der Publikation »Meteorologische Beobachtungen in Deutschland«) unterscheidet sich vom vorigen Jahrgang nur durch die Aufnahme der Jahres-Zusammenstellungen und fünftägigen Temperaturmittel von Wilhelmshaven und der Aufzeichnungen des Thermographen in Kaiserslautern, welche für 1887 wegen zu grosser Lücken in den Registrirungen in Fortfall gekommen waren.

Am Schlusse findet sich als Nachtrag zum III. Theil des vorigen Jahrganges eine Darstellung des Verlaufs der stürmischen Witterung an der ganzen Küste vom 1. bis 3. Dezember 1887.

I. und II. Theil.

Eine Aenderung in der Anordnung und Bearbeitung des Stoffes hat nicht stattgefunden; nur wurde im I. Theil der Ausdruck »Polarbanden« (Pbd.) durch »Radiationsstreifen« (Rad. str.) ersetzt. Bezüglich der Erläuterungen kann daher auf die Einleitung des vorigen Jahrgangs verwiesen werden, und es erscheint genügend, hier nur wenige Angaben folgen zu lassen. Die Extrem-Thermometer werden beide morgens 8 Uhr abgelesen und die Angaben für den Beobachtungstag eingetragen, so dass im I. Theil die Maximum-Temperaturen je dem vorhergehenden Tag entsprechen; die Angaben der Extrem-Thermometer werden durchweg mit den Termin-Ablesungen des trockenen Psychrometer-Thermometers verglichen und bei Widersprüchen, die übrigens auf der Mehrzahl der Stationen selten vorkommen, nach den Notirungen dieser Thermometer berichtigt.

In den Jahres-Zusammenstellungen wurden wieder als Tage mit ⚑ diejenigen Tage gezählt, an welchen das Stations-Anemometer in wenigstens einer Stunde 15 Meter oder mehr mittlere stündliche Windgeschwindigkeit pro Sekunde registrirt hatte, und es wurden die Tage, wo derartige Registrirwerthe nicht erreicht wurden, wohl aber bei einer Terminbeobachtung oder zu einer anderen Zeit Wind von der Stärke 8 und darüber beobachtet wurde, besonders gezählt und ihre Zahl in Klammern beigefügt. Für Rügenwaldermünde konnte nur die letzte Art der Zählung stürmischer Tage stattfinden, da ein Anemometer dort nicht aufgestellt ist.

In den Jahres-Zusammenstellungen sind die mittleren monatlichen Temperaturen für die Monate Mai bis August nach der Formel $\frac{1}{4}(8^a+8^p+\text{Max.}+\text{Min.})$, für September bis April nach der Formel $\frac{1}{2}\left(\frac{8^a+8^p}{2}+\frac{8^a+2^p+8^p}{3}\right)$ in gleicher Weise wie die fünftägigen Temperaturmittel berechnet. Die übrigen Mittelwerthe sind als arithmetische Mittel aus den Terminmitteln abgeleitet.

Endlich sei bezüglich der Fälle, wo bei den mit Ausfall von Registrirungen der Windrichtung verbundenen Störungen im Gange der Anemometer-Uhren mittlere registrirte Geschwindigkeiten sich angegeben finden, auf die früheren Angaben an genannter Stelle verwiesen.

In Betreff der im Jahre 1888 angestellten vorliegenden Beobachtungen ist hervorzuheben, dass die Angaben des Maximum-Thermometers in Memel wegen nachträglich festgestellten mangelhaften Funktionirens des Instruments unsicher erscheinen müssen; dass in Borkum in Folge Wechsels des die Beobachtungen ausführenden Angestellten, des Hôtelbesitzers Köhler, seit dem 12. September die Windstärken fortgelassen werden mussten, und dass für Rügenwaldermünde die Angaben der Bewölkung erst seit September, die eines Maximum-Thermometers von Oktober an aufgenommen werden konnten.

Im Laufe des Jahres 1888 wurden alle Normal-Beobachtungs-Stationen, ausser Borkum, sowie die Ergänzungsstation Rügenwaldermünde inspizirt. Die hierbei gefundenen Aenderungen der Barometer-Korrektionen (nebst Datum der Anwendung der neuen Korrektion) sind folgend zusammengestellt: Neufahrwasser +0.2 (1. Juli), Kiel —0.5, (Heberbarometer, 1. Sept.), Wustrow +0.2 (1. Juli), Swinemünde +0.3 (1. Sept.) und Rügenwaldermünde —0.1 (1. Juli). Hierbei ist zu bemerken, dass die Korrektion der Thermometer an den Barometern nicht gesondert angebracht, sondern mit der eigentlichen Standkorrektion des Barometers vereinigt wird.

In den Jahres-Zusammenstellungen erscheinen sämmtliche Barometerstände mit den neu ermittelten Korrektionen gleichartig behaftet, da ein bestimmter Zeitpunkt für die Aenderung der Korrektionen nicht festzustellen war und eine Vertheilung der Aenderung auf die Intervalle seit den letzten Vergleichungen der Barometer nicht rathsam erscheint.

Die bei Gelegenheit der Inspektionen ausgeführten Vergleichungen der Thermometer mit einem Normal-Thermometer ergaben durchweg nur geringe Aenderungen, sodass von einer nachträglichen Berichtigung früherer Beobachtungen abgesehen werden konnte.

Ueber die Art und Aufstellung der Registrir-Apparate giebt die Einleitung des vorigen Jahrgangs vollen Aufschluss, nur sei hier noch ergänzend hinzugefügt, dass das Anemometer in Wilhelmshaven auf dem westlichen Thurme des dortigen Observatoriums in etwa $1\frac{1}{2}$ Meter Höhe über der Brüstung, in $17\frac{1}{2}$ Meter Höhe über dem Erdboden und in 21 Meter Höhe über dem Meeresspiegel aufgestellt ist.

III. Theil.

Die seit dem Jahre 1878 eingeführte Sturm-Statistik wurde auch in diesem Jahre, analog den früheren Jahrgängen, für die deutsche Nord- und Ostseeküste durchgeführt.

Von den Aufzeichnungen an den Signalstellen wurden nur Rixhoft und Altona bei dieser Publikation ausgeschlossen; erstere Station wegen mangelhafter Ausfüllung der Tagebuchblätter und letztere der Nähe Hamburgs wegen.

Nur solche Fälle wurden hier zur Veröffentlichung gebracht, in welchen stürmische Winde auf grösserem Gebiete mindestens an drei Stationen auftraten.

Die neben den Stationsnamen stehenden, auch in den Bemerkungen angewandten und durch den Druck hervorgehobenen arabischen Zahlen geben das Datum an.

Die Bewölkung wird durch die Ausfüllung der Kreise bezeichnet, wie dieses auch in den synoptischen Karten der Seewarte geschieht:

○ = wolkenlos,
◔ = heiter,
◑ = halb bedeckt,
◕ = wolkig,
● = bedeckt,

entsprechend wurde für Regen das Zeichen • und für Schnee das Zeichen ✱ neben einen vollen Kreis gesetzt.

Die eingeklammerten Zahlen neben der Bewölkung bezeichnen den Seegang und zwar:

0 = schlicht,
1 = sehr ruhig,
2 = ruhig,
3 = leicht bewegt,
4 = mässig bewegt,
5 = ziemlich grobe (unruhige) See,
6 = grobe See,
7 = hoch,
8 = sehr hoch,
9 = äusserst (gewaltig) hoch.

Die gebrauchten Abkürzungen und die den Kongress-Beschlüssen entsprechenden Zeichen sind, wie auch im I. Theil, die folgenden:

ab. = abends, mg. = morgens,
tg. = tags, mtg. = mittags,
a. resp. a. m. = vormittags,
p. resp. p. m. = nachmittags,
^{a} und ^{p} — als Exponenten bei der Tagesstunde — Abkurzung für a. m. und p. m.
0^p resp. 12^a = Mittag,
0^a resp. 12^p = Mitternacht,
n. = in der (vorhergehenden) Nacht,
I, II, III bedeuten die Zeit der Terminbeobachtungen, resp. 8^h a. m., 2^h p. m. und 8^h p. m.

[1] In **Memel** funktionirte das Maximum-Thermometer zeitweise nicht genügend, und sind daher die Mittel von Mai bis August zum Theil etwas zu klein.
[2] In **Rügenwaldermünde** sind die Mittel von Mai bis August auch nach der Winterformel berechnet, weil ein Maximum-Thermometer nicht funktionirte.

19. Morgens starker Sturm aus NE mit heftigen Böen und Schneetreiben. Vormittags 10½ Uhr fing es stark an zu glatteisen und Eisnadelniederschlag mit heftigen Böen, welches bis kurz nach Mitternacht anhielt, dann nahm die Stärke des Windes ab und die Böen wurden schwächer, so dass am **20.** mittags nur noch mässiger ENE-Wind mit Schneefall war. Höchste Windstärke nach dem Anemograph. am **19.** von 8^a–9^a = 23.9 m u. von 10^a–11^a = 23.0 m. Barometer fing am **18.** abends an zu fallen und erreichte um Mitternacht den **19.** den niedrigsten Stand, worauf es langsam zu steigen anfing. Schäden auf See sind wohl nicht vorgekommen, weil, soweit das Auge reicht, das Wasser mit einer Eisdecke versehen ist. Vorwort.

Das Vorwort zum Jahrgang X dieser Publikation verbreitete sich im Einzelnen über alles das, was mit der Entwicklung der Herausgabe deutscher meteorologischer Beobachtungen seit 1876 im Zusammenhange steht; es mag deshalb im Wesentlichen darauf verwiesen und hier nur das berührt werden, was eine unmittelbare Beziehung zum vorliegenden Bande hat. Wir entnehmen jenem Vorworte daher mit entsprechender Abänderung die nachfolgenden Bemerkungen.

Da die Herausgabe der »Meteorologischen Beobachtungen in Deutschland« durch Beschluss deutscher Meteorologen und Vertreter meteorologischer Institute in Deutschland im Jahre 1876 erfolgt war, so konnte dieselbe nicht ohne Weiteres sistirt werden, vielmehr wurde es für erforderlich erachtet, einen Beschluss der nun vollzählig vertretenen Institute herbeizuführen, was durch eine bei Gelegenheit der Jahresversammlung der Deutschen Meteorologischen Gesellschaft in Karlsruhe zusammenberufenen Konferenz der Vorstände der meteorologischen Institute in Deutschland im April 1887 auch bewirkt worden ist. War man auf dieser Konferenz sich darüber einig, dass eine Herausgabe der Meteorologischen Beobachtungen in Deutschland hinfort seitens der einzelnen Institute zu erfolgen habe, so war man auch überzeugt, dass das einheitliche Band für diese Veröffentlichung sich nicht lösen dürfe und durch ein äusseres Zeichen fernerhin gewahrt bleiben müsse. In diesem Sinne wählte man die allen einzelnen Herausgaben gemeinsame Ueberschrift **„Deutsches Meteorologisches Jahrbuch“**, zu welcher noch das Land oder das System hinzugefügt werden sollte. Als Zeitpunkt für den Beginn der neuen Publikation setzte die Konferenz den 1. Januar 1887 fest. Ferner erschien es wünschenswerth, dass die einmal errungene Zusammengehörigkeit dadurch gewahrt bleiben sollte, dass der Veröffentlichung der Deutschen Seewarte die Inhalts-Verzeichnisse auch der Veröffentlichungen der übrigen Deutschen Institute einverleibt würden; es war Dies um so empfehlenswerther, als durch ein solches Verfahren die bibliographische Uebersicht deutscher meteorologischer Publikationen sehr erleichtert werden konnte.

Der nun der Oeffentlichkeit übergebene Band **„Deutsches Meteorologisches Jahrbuch für 1889, Beobachtungs-System der Deutschen Seewarte“** ist nach den im Vorstehenden niedergelegten Gesichtspunkten zusammengestellt und erscheint als Jahrgang XII. Um nun auch die beiden Jahrgänge 1876 und 1877 in die Serie mit einzuschliessen, wurde der Bezeichnung und Nummerirung noch hinzugefügt: »Vierzehnter Jahrgang der Meteorologischen Beobachtungen in Deutschland.«

Die Einleitung zu dem vorliegenden Bande enthält alles zum Verständnisse der in demselben niedergelegten Resultate Erforderliche, sowie (S. X) eine Uebersicht über das Gesammtresultat der bisherigen Jahrgänge.

Einleitung.

Der vorliegende Jahrgang »Deutsches Meteorologisches Jahrbuch für 1889, Beobachtungs-System der Deutschen Seewarte« (Zwölfter beziehungsweise vierzehnter Jahrgang der Publikation »Meteorologische Beobachtungen in Deutschland«) unterscheidet sich vom vorigen Jahrgang nach seinem Inhalt nur durch die Aufnahme der Anemometer-Registrirungen von Borkum pro Juli bis Dezember (vgl. S. VII) Eine Aenderung in der Anordnung und Bearbeitung des Stoffes hat nur insoweit stattgefunden, als die Anzahl der mitgetheilten Dezimalstellen mehrfach eine weitere Beschränkung erfahren hat, und in der Zusammenstellung der monatlichen und der Jahres-Resultate auch die Monatsmittel der Maximum- und der Minimum-Temperaturen aufgenommen wurden.

I. Theil.

Zur Beobachtung des Luftdruckes sind die Stationen mit einem Normal-Gefäss-Heberbarometer (System Köppen-Fuess) und einem Stationsbarometer ausgerüstet, ausgenommen Kiel und Rügenwaldermünde, wo nur ein Heberbarometer bezw. ein Gefässbarometer vorhanden war. Im Allgemeinen finden die Beobachtungen, nach Vorschrift der Instruction, am Gefässbarometer statt, und dient das andere Barometer durch öftere gleichzeitige Ablesungen nur zur Kontrolle eines unveränderten Standes; bei Inspektionen werden stets beide Barometer mit dem Reise-Instrument verglichen. Bei den i. J. 1889 ausgeführten Inspektionen (vgl. S. VII) der Stationen ergab sich nirgends eine zu berücksichtigende Aenderung von Barometerkorrektionen.

Der von der Seewarte angenommene Normalstand ist am 1. Jan. 1887 um 0.46 mm erniedrigt worden, in dieser Publikation jedoch schon im Jahrgang 1886 (s. d. Seite IV) Theil I zu Grunde gelegt, sodass die Barometerstände seitdem um 0.46 mm relativ kleiner als früher sind.

Die Thermometer sind in einem, erforderlichen Falls gegen Strahlung durch Schirme geschützten, doppelwandigen Thermometergehäuse von Zinkblech meist auf der Nordseite von Gebäuden untergebracht; eine einfache Vorrichtung gestattet, das Gehäuse ohne Oeffnen des Fensters heranzuziehen und die Ablesungen vorzunehmen, da jene Vorrichtung selbstthätig ein Oeffnen resp. ein Schliessen des Gehäuses bewirkt.

Zur Beobachtung der Luftfeuchtigkeit dient das Psychrometer, und zwar werden die absolute wie die relative Feuchtigkeit aus den Tafeln von Jelinek ohne weitere Korrektion entnommen. Die Kugel des feuchten Thermometers wird bei Temperaturen über Null immer feucht gehalten, bei Frostwetter nach (erforderlichen Falls ausserdem vor) jeder Beobachtung von Neuem befeuchtet.

Um richtige Werthe der Luftfeuchtigkeit zu ergeben, muss das Psychrometer besonders in trockener Witterung sehr umsichtig behandelt werden; die genügende Feuchtigkeit der Umhüllung des feuchten Thermometers bedarf steter Kontrolle — eine Vorschrift, die leicht unbeachtet bleiben kann und dann in der Regel mangelhafte Beobachtungen der Feuchtigkeit während längerer Zeit zur Folge hat. Wenngleich kein zuverlässiges Kriterium für die Güte der Feuchtigkeitsmessungen besteht, falls nur Beobachtungen des Psychrometers vorliegen, so sind im I. Theil doch besonders auffällige Beobachtungen als zweifelhaft mehrfach hervorgehoben worden. Es erschien empfehlenswerth, vor Eintritt der trockenen Jahreszeit die Herren Beobachter durch ein Rundschreiben auf die Nothwendigkeit einer umsichtigen Behandlung des Psychrometers hinzuweisen.

Die Maximum-Thermometer sind Quecksilber-Thermometer mit oberhalb der Kugel durch eingeschmolzenen Glassplitter künstlich verengerter Röhre; sie werden bei der Morgenbeobachtung abgelesen und neu eingestellt, die Ablesung wird für den Tag der Ablesung in die Tabellen eingetragen, sodass also die höchsten Temperaturen um einen Tag vorwärts verschoben erscheinen; in der Jahres-Uebersicht sind daher die Eintrittszeiten der höchsten Temperaturen um je einen Tag zurückdatirt.

Zur Bestimmung der niedrigsten Temperaturen dienen Alkohol-Minimum-Thermometer mit Glasstift als Index; sie werden morgens abgelesen, bei der Mittagbeobachtung eingestellt und die Ablesungen für den Beobachtungstag eingetragen, sodass die niedrigste Temperatur des Zeitraumes von 2^h p. m. bis 8^h a. m., also je eines nur 18stündigen Zeitraumes, beobachtet wird.

In den Monatstabellen werden die Angaben der Extrem-Thermometer durchweg mittels der Termin-Beobachtungs-Temperaturen kontrollirt und bei gelegentlichen Widersprüchen durch die betreffenden mehr extremen Ablesungen des trockenen Thermometers ersetzt.

Die Windrichtungen werden nach der sechzehntheiligen Windrose rechtweisend notirt, die Windstärken nach der Beaufort-Skala (0—12) geschätzt.

Die Bewölkung wird nach den Zahlen 0—10 geschätzt, wo 0 einen wolkenlosen, 10 einen ganz bedeckten Himmel bezeichnen, wobei die Intensität der Wolkendecke keine Berücksichtigung findet. Die Notirung Nebel (≡) bedeutet, dass der Beobachter sich zur Zeit der Beobachtung wirklich im Nebel befand.

Es verdient hervorgehoben zu werden, dass wohl keine Vorschrift gegeben werden könnte, die für alle Beobachter genau das gleiche Unterscheiden zwischen Nebel und Dunst zu sichern vermöchte, und dass aus diesem Grunde sowohl die Vergleichbarkeit der Nebelnotirungen von Station zu Station, als auch an Stationen, wo mehrere Beobachter fungiren, der Einblick in die tägliche und jährliche Periode, besonders durch die Berücksichtigung der Beobachtungen mit leichtem Nebel beeinträchtigt wird.

Zur Messung des Niederschlags dienen zwei gleiche neben einander aufgestellte Regenmesser von 500 qcm Oeffnung und ein getheiltes Messglas, welches die Zehntel Millimeter direkt ablesen lässt. Der Niederschlag wird um 8 Uhr morgens und abends bestimmt und die Niederschlagsmenge des laufenden Tages gleich dem am Abend plus dem am folgenden Morgen gemessenen Niederschlag berechnet, so dass die gedruckten täglichen Niederschlagsmengen den Niederschlag für die auf 8^h a. m des betreffenden Tages folgenden 24 Stunden angeben. Für beobachtete, aber unter 0.1 mm bleibende Niederschläge ist in der Niederschlags-Kolumne 0 0 gesetzt.

Die Beobachter haben die Vorschrift, neben der genauen Notirung der Hydrometeore zu Zeiten der Terminbeobachtungen, den atmosphärischen Vorgängen fortwährende Aufmerksamkeit zu schenken, Zeit und Art der Niederschläge, Beobachtungen über stürmische Winde etc. möglichst in die Journale einzutragen, doch lehrt die Erfahrung, dass persönliche Neigung einen bedeutenden Einfluss auf die Vollständigkeit dieser Beobachtungen ausübt. Die Vergleichbarkeit der Zahl von Tagen mit besonderen Witterungserscheinungen, Gewittern etc. erleidet hierdurch in demselben Sinn Einbusse, wie solches bereits aus anderer Ursache für die Nebelbeobachtungen hervorgehoben wurde.

Ausser den direkten Beobachtungen über den Verlauf der Witterung und sonstige besondere Erscheinungen sind im ersten Theil unter „Bemerkungen" durch das Zeichen ⌴ш noch die Stunden angegeben, wo die Anemometer im stündlichen Durchschnitt 15 m und mehr pro Sekunde angaben (vgl. S. VII). Wo diese Stunden in Folge Ausfalls der Registrirungen nicht angegeben werden konnten, findet sich die betreffende Bemerkung beigefügt. In Rügenwaldermünde ist kein Anemograph aufgestellt; für diese Station bedeutet S. 49—54 das Zeichen ⌴ш nur beobachtete Windstärken 8 und darüber. Die in dem Werke gebrauchten Abkürzungen und die den Kongress-Beschlussen entsprechenden Zeichen sind folgende:

ab. = abends, mg. = morgens,
tg. = tags, mtg. = mittags,
a. resp. a. m. = vormittags,
p. resp. p. m. = nachmittags,
^{a} und ^{p} — als Exponenten bei der Tagesstunde — Abkürzung für a. m. und p. m.
0^p resp. 12^a = Mittag,
0^a resp. 12^p = Mitternacht,
n. = in der (**vorhergehenden**) Nacht,
I, II, III bedeuten die Zeit der Terminbeobachtungen, resp. 8^h a. m., 2^h p. m. und 8^h p. m.

Die weitere Zeitangabe „früh" bezeichnet eine Zeit vor 8^h morgens und im Allgemeinen einen früheren Zeitpunkt als die Zeitangabe ›*a*‹, ebenso wie in Folge der Benutzung der Zeitangabe ›ab‹ (und Mittag = mtg.) die Bezeichnung ›*p*‹ durchschnittlich eine frühere Nachmittagszeit (etwa $2-5^p$) als die Abendstunden angiebt.

In den Jahres-Zusammenstellungen sind die mittleren monatlichen Temperaturen für die Monate Mai bis August nach der Formel $\frac{1}{4}(8^a+8^p+\text{Max.}+\text{Min.})$, für Septbr. bis April nach der Formel $\frac{1}{2}\left(\frac{8^a+8^p}{2}+\frac{8^a+2^p+8^p}{3}\right)$ in gleicher Weise wie die fünftägigen Temperaturmittel berechnet. Die übrigen Mittelwerthe sind als arithmetische Mittel aus den Terminmitteln abgeleitet.

Die für 760 mm gegebene Schwerekorrektion dient zur Reduktion auf die Schwere in 45° Breite (vgl. Einleitung des IX. Jahrgangs, 1886, S. III).

Es bedeuten H, h_t und h_r die resp. Höhen des Barometers über dem mittleren Meeresspiegel, der Thermometer und der Oeffnung des Regenmessers über dem Erdboden.

Als Zahl der Tage mit Niederschlag (Kolumne ●, ✶, ▲, △) sind alle Tage gezählt, an welchen Niederschlag in Form der überschriftlich angegebenen Hydrometeore beobachtet wurde, gleichviel ob messbar oder nicht; Tage mit Niederschlag, von ≡, V, ⌴, ⌓ allein herrührend, wurden nicht berücksichtigt. Die Zahl der Tage je mit ✶, △ ▲, T ℾ, ≡ wurden gleich der Zahl der Reihen, in welchen diese Zeichen in der Rubrik ›Bemerkungen‹ vorkommen, angenommen.

Als Tage mit ⌴ш wurden die Reihen gezählt, in welchen Stunden mit 15 m pr. Sek. und mehr Windgeschwindigkeit nach dem Anemometer vorkamen, und wurde neben deren Zahl die Zahl der weiteren Tage, wo stürmische Winde (mehr böigen Charakters) ohne so grosse mittlere stündliche Windgeschwindigkeit beobachtet wurden, in Klammer hinzugefügt. Für Rügenwaldermünde haben die gegebenen Zahlen nur die Bedeutung der gezählten Tage mit beobachteten stürmischen Winden von der Stärke 8 oder mehr. Es sei hervorgehoben, dass jene Zählung der Tage mit ⌴ш nach dem Anemometer, unter Annahme eines gleichen Minimums von 15 m registrirter Windgeschwindigkeit für

alle Stationen, einen Vergleich der so berechneten Häufigkeiten stürmischer Winde von Ort zu Ort selbst bei genau gleicher Aufstellung und Umgebung der Anemometer nur dann zulassen wird, wenn die Angaben der Anemometer gemäss dem Ergebniss ihrer Prüfung reduzirt und die Instrumente dauernder Kontrolle unterworfen werden — Voraussetzungen, die meist kaum zu erfüllen sein werden. Vergleichbare Zahlen für die Häufigkeit stürmischer Winde liefern die Anemometer erst dann, wenn die verschiedenen Grenzwerthe der stündlichen mittleren Windgeschwindigkeiten ermittelt sind, welche für jedes Anemometer und seine Umgebung den Eintritt stürmischer Witterung bedeuten, und wenn diese der Zählung der Tage mit ⫫ zu Grunde gelegt werden. Ein Versuch der Ableitung solcher Zahlen ist von Herrn Prof. van Bebber ausgeführt, und findet sich im XIV. Jahrgang »Monatsberichte der Deutschen Seewarte, 1889«, im Beiheft II, S. 9, wo sich als vorläufige, vielleicht noch weiter zu prüfende, gleichwerthige untere Grenzwerthe der stürmischen Winde in Metern pro Sekunde (stündliche Mittel)

ergeben haben.

Als heitere und trübe Tage wurden solche gezählt, an welchen die Bewölkung im arithmetischen Mittel aus den Terminbeobachtungen kleiner als 2, resp. grösser als 8 war.

Die nach 16 Strichen der Windrose beobachteten Windrichtungen sind auf 8 umgerechnet durch gleichmässige Vertheilung der Anzahl der fortfallenden Richtungen auf die benachbarten.

Bezüglich der Berechnung der fünftägigen Temperaturmittel finden sich bereits oben die nöthigen Angaben.

Eine Verlegung der Station fand in Borkum am 8. Juni $2^1/_2$ Uhr nachmittags statt, die damit verbundene Umstellung des Regenmessers erst am 19. Juni; die meteorologische Station befindet sich jetzt im Nebengebäude des Bahnhofs der Inselbahn, wo die Barometer in einem Zimmer des ersten Stockwerkes und das Thermometergehäuse vor einem seiner Fenster Aufstellung fanden. Ein Beamter der Privatbahn steht der Station seitdem vor. Von den Registrirapparaten hat das Anemometer seine bisherige Aufstellung auf dem alten Leuchtthurm beibehalten, während der Barograph erst bei Gelegenheit der Inspektion i. J. 1890 umgehängt und neben den Barometern angebracht wurde; die Aenderung seiner Aufstellung bei Gelegenheit der Verlegung der Station war nicht ausführbar, da diese von dem Beobachter allein ausgeführt werden musste. Um das regelmässige Funktioniren des Anemometers zu sichern, wurde dasselbe im April 1889 mit einer Zylinderuhr an Stelle der früheren Pendeluhr ausgerüstet, da diese beim Läuten einer in dem genannten Thurm aufgehängten Glocke häufig stehen geblieben war; in Folge des regelmässigen Funktionirens konnten die Anemometer-Registrirungen von Juli bis Dezember in diesem Werk Aufnahme finden. Die Beobachtungen in Borkum entsprachen leider nicht durchweg den zu stellenden Anforderungen, wie aus Seite 37—42 ersichtlich ist, und insbesondere schienen die geschätzten Windstärken so wenig zuverlässig, dass sie für den grösseren Theil des Jahres nicht aufgenommen wurden. In Folge eines Missverständnisses des neuen Beobachters wurde ferner die Bewölkung des Himmels nicht nach den Graden 0—10, sondern nur das Wetter nach der Telegramm-Skala beobachtet, und in der Monats-Tabelle als Grad der Bewölkung die Zahl eingetragen, welche die Wolkenform angiebt; so blieb der Irrthum leider bis November unbemerkt. Die Notirungen nach der Telegramm-Wetter-Skala 0—4 wurden resp. durch 0, 2.5, 5, 7.5 und 10 ersetzt und weiter bei Dunst die Bewölkung gleich 0, bei Niederschlägen, Gewitter und Nebel gleich 10 angenommen; die in dieser Weise erhaltenen Mittelzahlen dürften den wahren, nach der Skala 0—10 gewonnenen Werthen ziemlich nahe kommen. Wegen der Feuchtigkeitsbeobachtungen im Mai und Juni vergleiche obige Bemerkung (S. V).

Ein Wechsel des Beobachters oder eine Verlegung der Station fand an keiner der übrigen Normalbeobachtungs-Stationen statt, und wo ersterer auf den Signalstellen erfolgte, ist auf S. XI zu ersehen.

Im Jahre 1889 wurden folgende Signalstellen und Normalbeobachtungs-Stationen revidirt: Hela, Rixhöft, Leba, Stolpmünde, Rügenwaldermünde, Brunshausen, Kuxhaven, Geestemünde, Bremerhaven, Wilhelmshaven, Schillighörn, Wangerooge, Karolinensiel, Nesserland-Schleuse und Borkum (vor Verlegung der Station).

II. Theil.

Die vorliegenden Aufzeichnungen des Luftdruckes sind für Hamburg bis Anfang August von einem Sprung'schen Barographen geliefert, welcher u. A. in »Aus dem Archiv der Deutschen Seewarte (VII. Jahrgang, Nr. 2, S. 29)« beschrieben ist; seit Juni traten häufiger Störungen der Registrirungen ein, so dass der Apparat Anfang August zwecks Reparatur ausser Thätigkeit gesetzt wurde; die weiteren Luftdruckangaben bis Ende des Jahres stammen von einem Gewichtsbarographen Fuess, dessen Registrirungen in ähnlichen Fällen stets benutzt worden waren. Ein gleicher Gewichts-Barograph Fuess, beschrieben u. A. in »Aus dem Archiv der Deutschen Seewarte (I. Jahrg., Instruktion für den meteorologischen Dienst der Deutschen Seewarte, S. 28)« befindet sich auf den übrigen Stationen der Seewarte. Während der Sprung'sche Barograph fortlaufend und unmittelbar wahre Werthe aufzeichnet, liefert der Gewichts-Barograph Fuess nur viertelstündliche Werthe, welche erst auf wahre Werthe umgerechnet werden müssen. Hierbei wird nicht die gleiche Methode befolgt: Für Hamburg und Keitum wurden mittels zweier fester Konstanten, die aus den Aufzeichnungen und Barometer-Ablesungen eines oder mehrerer Monate graphisch abgeleitet werden, die Barogramm-Ordinaten zunächst nach linearer Formel auf annähernd wahre Luftdruckwerthe reduzirt (mittels graphischer Methode),

dann die Differenzen dieser Werthe gegen die auf 0 Grad korrigirten Terminablesungen des Barometers gebildet, und durch lineare Vertheilung deren Aenderungen zwischen je 2 aufeinander folgenden Terminen der Anschluss an die Terminbeobachtungen (resp. in gleicher Weise an eigens zu dem Zweck regelmässig angestellte Beobachtungen, wie bei dem Thermographen in Hamburg) bewirkt; auf den übrigen Stationen wurde von einem Termin zum anderen der jedesmalige Reduktionsfaktor durch Divison der beobachteten Luftdruckänderung durch die entsprechende Aenderung der Ordinate der Barographen-Registrirung berechnet und wurden mittels desselben die Registrirungen der Zwischenzeit reduzirt und an die Terminbeobachtungen angeschlossen. Da bei dieser Methode kleine Ungenauigkeiten beim Ablesen oder bei der Reduktion der Ablesung unter Umständen einen sehr wesentlichen Einfluss auf das Resultat der Rechnung auszuüben vermögen, so wird erstere Methode auf allen Stationen eingeführt werden. Streng richtig ist dieselbe auch nicht, da die Abweichungen der, wie angegeben, zunächst berechneten annähernden Werthe von den beobachteten Werthen sich wesentlich in Folge von Temperatur-Einflüssen ändern und eine Gleichmassigkeit dieser Aenderung von Termin zu Termin somit nicht bedingt ist. Da die Barographen indessen auf den meisten Stationen im Zimmer neben dem Barometer untergebracht sind, so ist Sorge getragen, dass die Temperaturänderungen thunlichst gering sind und daher trotz einer nicht strengen Berucksichtigung (welche auch nicht durchzufuhren sein wurde!), das Resultat der Reduktion moglichst wenig beeinflussen.

Die Temperatur-Aufzeichnungen in Hamburg wurden einem Hipp'schen Thermographen, beschrieben unter Anderm in der »Instruktion für den Meteorologischen Dienst der Deutschen Seewarte« (S. 34), entnommen, welcher vor einem Nordost-Fenster im Erdgeschoss der Seewarte, nahe dem Thermometergebäude, gegen Strahlung wie dieses thunlichst geschützt, aufgestellt ist; bei den Störungen wurden die Registrirungen eines gleichartigen, in einer Wild'schen Thermometerhütte über dem Reservoir im Garten der Seewarte aufgestellten Thermographen eingesetzt.

Die Aufzeichnungen von Windrichtung und Windgeschwindigkeit wurden in Hamburg einem Anemographen nach Beckley mit Aenderungen von Fuess entnommen. Bei geringen Windgeschwindigkeiten unter 2 m pro Sekunde vermag die Windfahne den Aenderungen der Windrichtung nicht immer zu folgen, so dass die registrirten Windrichtungen bei so kleinen Geschwindigkeiten nicht ganz zuverlässig sind. Auf den übrigen Stationen befinden sich Anemographen nach Casella und Beckley, u. A. in »Aus dem Archiv der Deutschen Seewarte, I. Jahrgang 1878, Instruktion für den Meteorologischen Dienst der Deutschen Seewarte, S. 24—28« beschrieben.

Da bei diesen Anemographen die Abwicklung des dem zuruckgelegten Windweg an Länge proportionalen Papierstreifens von der Uhr des Instruments, welche nur die Stundenmarken bewirkt, unabhängig ist, so ist es möglich, bei einem Stehenbleiben der Uhr dennoch die mittlere stündliche Geschwindigkeit für die Zeit der Unterbrechung zu berechnen, während bei Störungen im Gange der Anemographen-Uhr in Hamburg, welche auch bei den Windweg-Aufzeichnungen mitwirkt, die Registrirungen eines gleich aufgestellten Anemographen nach Casella und Beckley, wie ihn die übrigen Stationen besitzen, eingesetzt werden.

Für die Umrechnung der Umdrehungen des Schalenkreuzes auf Windweg ist durchweg der Robinson-Factor 3 bei Ausführung der Apparate zu Grunde gelegt und eine Reduktion der Angaben der Apparate hat seither nicht stattgefunden; die angegebenen Geschwindigkeiten sind daher zu gross und besonders die grösseren Werthe nicht unerheblich zu gross.

Bezüglich der Aufstellung der Anemographen dienen folgende Angaben (Vergl. auch die obigen Bemerkungen über die Zählung der Tage mit ⏟, S. VI und VII.):

In Memel wurde im Jahre 1879 ein besonderes Holzhäuschen mit spitzem Dach errichtet und auf dessen Spitze das Schalenkreuz des Anemographen aufgestellt — 7 m über dem Erdboden und 14.6 m über dem mittleren Meeresspiegel.

Der Anemograph in Neufahrwasser ist seit 1878 auf dem erhöht liegenden Bahnhof aufgestellt, das Schalenkreuz in 12.2 m Höhe über dem Erdboden und in 18.3 m Höhe über dem mittleren Wasserstand der Ostsee. Die ursprüngliche freie Aufstellung hat seither durch die Aufführung benachbarter Hochbauten erhebliche Einbusse erlitten.

In Swinemünde befindet sich der Anemograph auf dem Thurm des Schifffahrts-Amtshauses; die Höhe des Schalenkreuzes über der Plattform des Thurmes beträgt 2.2 m, über seiner Brüstung 1.4 m, über dem Erdboden 24.2 m und 26.6 m über dem mittleren Spiegel der Ostsee.

Der Anemograph in Wustrow befindet sich von Anfang an in der Mitte des Dachfirstes des zweistöckigen Navigationsschulgebäudes frei aufgestellt, das Schalenkreuz 1.5 m über dem Dach, 13 m über dem Erdboden und ca. 17½ m über dem mittleren Spiegel der Ostsee.

In Kiel befindet sich der Anemograph frei aufgestellt auf einem eigenen Gerüst in der Nähe der Sternwarte, das Schalenkreuz 15.5 m über den Erdboden, und etwa 61 m über dem Meeresspiegel.

In Hamburg befinden sich die Anemometer (s. o.) auf dem Westthurm der Seewarte; die Höhe der Schalenkreuze beträgt 5.5 m über dem Boden der Plattform, 4.6 m über der dieselbe umgebenden Brüstung des Thurmes, 28.0 m über dem Erdboden und 58 m über dem Niveau der Elbe.

Der Anemograph ist in Keitum in der Mitte des Dachfirstes eines einstöckigen Hauses aufgestellt; das Schalenkreuz befindet sich 1.9 m über dem Dache, 8.9 m über dem Erdboden und etwa 17 m über dem Meeresspiegel; die ursprüngliche Güte der Aufstellung hat seither durch die vor dem Wohnhaus befindlichen Bäume mit reicher Kronenbildung Einbusse gelitten.

In Borkum befindet sich das Anemometer seit 1885 auf dem 41 m hohen alten Leuchtthurm, das Schalenkreuz 2.6 m über seiner Brüstung.

In **Wilhelmshaven** befindet sich das Anemometer auf dem westlichen Thurm des dortigen Observatoriums, das Schalenkreuz in etwa $1^1/_2$ m Höhe über der Brüstung, in $17^1/_2$ m Höhe über dem Erdboden und in 21 m Höhe über dem Meeresspiegel.

In **Kaiserslautern** befindet sich der Anemograph in der Mitte des Dachfirstes des Realschulgebäudes, das Schalenkreuz in 1.6 m Höhe über dem First, 21.3 m über dem Erdboden und etwa 257 m über dem Meere. Das Verhältniss zwischen registrirter Windgeschwindigkeit und geschätzter Windstärke erscheint für Kaiserslautern wesentlich kleiner als für die Stationen der Seewarte.

Bezüglich der Form der vorliegenden Anemometer-Registrirungen ist hervorzuheben, dass die angegebenen Windrichtungen sich auf den im Kopf angegebenen Zeitpunkt beziehen und die Geschwindigkeiten den Durchschnittswerth der beendeten Stunde bedeuten. Die übrigen Registrirtabellen bedürfen keiner Erklärung.

III. Theil.

Die seit dem Jahre 1878 eingeführte Sturm-Statistik wurde auch in diesem Jahre, analog den früheren Jahrgängen, für die deutsche Nordsee- und Ostseeküste durchgeführt.

Von den Aufzeichnungen an den Signalstellen wurden nur Rixhöft und Altona bei dieser Publikation ausgeschlossen; erstere Station wegen mangelhafter Ausfüllung der Tagebuchblätter und letztere der Nähe Hamburgs wegen.

Nur solche Fälle wurden hier zur Veröffentlichung gebracht, in welchen stürmische Winde auf grösserem Gebiete mindestens an drei Stationen auftraten.

Die neben den Stationsnamen stehenden, auch in den Bemerkungen angewandten und durch den Druck hervorgehobenen arabischen Zahlen geben das Datum an.

Die Bewölkung wurde durch die Ausfüllung der Kreise bezeichnet, wie dieses auch in den synoptischen Karten der Seewarte geschieht:

○ = wolkenlos, ◔ = heiter, ◑ = halb bedeckt, ◕ = wolkig, ● = bedeckt,

und entsprechend wurden für Regen, Schnee etc. die auf S. VI angegebenen Zeichen neben diese Kreise gesetzt.

Die eingeklammerten Zahlen neben der Bewölkung bezeichnen den Seegang und zwar:

0 = schlicht,
1 = sehr ruhig,
2 = ruhig,
3 = leicht bewegt,
4 = mässig bewegt,
5 = ziemlich grobe (unruhige) See,
6 = grobe See,
7 = hoch,
8 = sehr hoch,
9 = äusserst (gewaltig) hoch.

Die Bedeutung der Abkürzungen und der den Kongress-Beschlüssen entsprechenden Zeichen ist oben in den Erläuterungen zum I. Theil auf S. VI angegeben.

* bedeutet: nicht abgedruckt, liegt aber im Manuskript bei der Seewarte vor.

1) Jahrgang 1878 enthält Warnemünde Januar—Juni und Wustrow Juli—Dezember.

2) Jahrgänge 1888 und 1889 enthalten von Wilhelmshaven nur die Monats- und Jahres-Uebersichten und die fünftägigen Temperaturmittel.

II. Die Aufzeichnungen von Registrir-Apparaten in dem durch folgende Tabelle dargestellten Umfange, wobei *A* den Anemographen, *B* den Barographen und *T* den Thermographen bedeuten; die hinzugefügten *a*, *b*, *t* bezeichnen entsprechend die Registrir-Tabellen, welche ausser den veröffentlichten noch im Manuskript bei der Seewarte vorhanden sind.

*) Wegen theilweisen Ausfalls der Registrirungen des Anemometers am 11. und 12. Januar konnten die Stunden mit 15 Meter und mehr Geschwindigkeit an diesen Tagen nicht angegeben werden.
Die Schätzung der Windstärken war bis zum 20. April wenig zuverlässig.

*) Am 8. Juni, 2½ʰ p. m., wurde die Station nach dem Bahnhof der Inselbahn verlegt; die **Barometerstände** beziehen sich seit dem **1. Juni** auf das neue Niveau und erscheinen gegen die früheren um 0.5 mm niedriger.
Die Feuchtigkeitsangaben der ersten Dekade erscheinen zweifelhaft.
Wegen der **Bewölkungsgrade** vom **8. Juni** an und des Fehlens der geschätzten **Windstärken** vergl. Einleitung.

15) Erscheinungen aus dem Pflanzenreich.
16) Vieljährige Mittel der Niederschlagshöhen (Fortsetzung) in Stuttgart.
17) Niederschlagshöhen in Stuttgart, gemessen an drei Terminen.
18) Die Hagelwetter am 13. Juli 1889.
19) Beigaben:
    I. Jahres-Isothermen von 1889.
    II. Jahres-Isohyeten von 1889.
    III. Graphische Darstellung der mittleren Niederschlagshöhen in Stuttgart, gemessen an drei Terminen.
    IV. Uebersichtskarte zum Hagel am 13. Juli 1889.

Beobachtungs-System des Reichslandes **Elsass-Lothringen.**

Ein meteorologisches Jahrbuch für 1889 ist in Vorbereitung, doch seine Drucklegung zur Zeit noch nicht endgültig beschlossen. Dasselbe wird voraussichtlich dreimal-tägliche Beobachtungen von 6 Beobachtungs-Stationen II. Ordnung, darunter von einer Gipfelstation in 1400 m Hohe, sowie die Monats- und Jahres-Uebersichten von im Ganzen 12 Stationen II. Ordnung und die Messungen an den Regenstationen enthalten.
